Abstract Of The Disclosure

A document generation system produces a document from information derived from

5   an information repository. The document generation system includes a source of code, a

source of document generation control information, and a document processor. The source of

code represents a document template including data fields containing placeholder items to be

replaced by desired data items, and a repetition identifier indicating that one of the data fields

is to be replicated to provide a group of data fields to be replaced by the desired data items.

10   The source of document generation control information supports insertion of the desired data

items derived from the information repository in the data fields. The document processor

applies the control information in replacing template document data field placeholder items

with desired data items to produce a generated document.
